# Good Design - ChatGPT

The ChatGPT web application is an example of a good design because it is simple and straight to the point. The platform knows why you've entered the site, so the first thing it does is provide you with a clear chat room so that you can chat with the bot right away without wasting time. It also provides prompt suggestions, which is a nice touch. You can also easily navigate through older conversations with the bot in a very intuitive way.

Bad Design - Recycling Bins

These recycling bins, despite their attractive appearance and organization, suffer from a major functionality flaw. I have these bins at home, and I can confirm they tend to cause issues. The problem arises because the flap for depositing garbage is located on the upper side of the bin. As the bins fill up, attempting to open the flap often results in upper garbage falling to the ground. This limits the bins' capacity and cleanliness. A superior design would place the flap on top of the bin, allowing for full use without the risk of making a mess on the ground.
